/ A&S Fersa®

Fersa is an international company based in Zaragoza, Spain, known for its innovative approach to business. Our long experience, together with our access to the latest R&D technologies and modern manufacturing and supply-chain processes, has quickly placed us among the leading European bearing manufacturers.

Key to our success in becoming a global company present in more than 60 countries is the firm determination of our staff to try and exceed our customer's expectations through constant innovation.

The trust our customers have placed in us furthers our presence in all five continents and has been essential to establishing the Fersa brand as a reference of excellence, whose success is the result of a joint company-customer collaboration process.

Today, the market diversification strategy implemented right from the start means that more than 95% of our sales come from exports originating in Spain. Fersa has not only expanded production capacity in its Zaragoza plant by 300%, but has also built a new plant in Jianxing, China, in order to supply the manufacturing facilities of our global T1 customers in China.

Our passion for quality and for our customers, not only engages us in the continuous pursuit of excellence but it has become our style of management.

We hope that the information included in this new catalog, a product of this joint collaboration, will be of interest to you, as well as useful in your own pursuit of excellence.

# / Fersa history

**Currently, 90% of our turnover comes from exports to more than 60 countries on various continents.**

---

The history of Fersa Bearings goes back to 1968, when two family-owned businesses joined forces to create A&SFersa. As the company acquired international recognition, the name was changed to Fersa Bearing S.A., as it is known today.

Key to the success enjoyed since its beginnings has been the professional experience and technical know-how of the entire staff (from R&D through sales), as well as the shareholders determination to continuously invest in people and capital, in order to modernize all areas of the company.

Every product offered in our broad product line, be it for industrial, heavy vehicles or passenger car applications, is developed with the latest design and quality validation processes. The strict quality control of these processes is guaranteed by the use and application of the latest technologies in engineering design and manufacturing technology.

---

## / The product

Fersa offers one of the largest tapered roller bearings product lines available in the market, including metric, inches and special series, and double-row tapered roller bearings (with over 900 references).

In addition, our product line includes single-row ball bearings in different versions, open, ZZ and 2RS and dimensions, and double-row ball angular contact bearings, designed for the automotive market. We also have cylindrical bearings standard and special series, and axial and clutch bearings.

A catalog that features over 1600 market references, and a team of professionals with more than 40 years experience, is ready to answer and respond all customers' inquiries.

The development of a new business area focused on the needs of the light vehicle market, has added a new complete kit wheel product line with over 350 references.

And also, our new line of compact wheel bearings for heavy vehicles applications, in three distinct categories: HWT (Hub Wheel Truck), KWT (Kit Wheel Truck) and CWT (Compact Wheel Truck), with more than 20 new references.

Our flexibility and dynamism makes it possible for us to add more than 100 hundred new references each year, many of which are designed to the specifications of our customers.

# / Innovation

---

The decision to make innovation the number one priority, was —and is—key to the sustainable growth of the company. Project teams in our R&D department optimize the advantages of Simultaneous Engineering with the customer and help us reduce time-to-market of new products. Pro-active Quality Project Teams ensure that each one of these activities is correctly performed.

Collaboration with top-level Spanish technological institutes helped us create the NBE (Network for Bearing Excellence) in 2007. A knowledge based network to access the most advanced tools for analytical calculations and virtual simulation, as well as a significant capability for experimental testing, with more than 20 test-benches designed to evaluate and validate the applications of our products.

The market introduction in 2009 of the “Fersa HiPro” bearings family, or the new product line for truck wheels applications, are just two examples of Fersa’s innovation capabilities.

Investing every year, the equivalent of 6% of sales revenue in Research and Development, ensures the sustainability of this corporate priority which in turn helps us exceed customer expectations our ultimate goal.

---

## / Manufacturing processes

The ambitious investments made in our manufacturing plants has increased our production capabilities, automatized manufacturing processes and upped the quality standards of our bearings, while maintaining our flexibility towards satisfying our customers' needs.

The high quality of our manufacturing process has been homologated by global T1 suppliers to the OEMs around the world, including passenger car and commercial vehicle axle manufacturers. For this reason, Fersa has not only expanded production capacity in its Zaragoza plant by 300%, but has also built a new plant in Jianxing, China, in order to supply the manufacturing facilities of our global T1 customers in China.

## / Quality

Throughout all our processes Fersa's staff is aware of the commitment to excellence made to our customers.

As manufacturer of high quality products, Fersa guarantees compliance with the highest standards of quality concerning the use of high quality steel in the production process, in the design of contact surfaces, and in correct packaging and lubrication of parts.

Our staff spares no effort to take care of the smallest details in order to ensure the best customer service, not only by supplying the best quality parts, but also by anticipating the possible needs of our customers in regards to service and deliveries.

In addition Fersa guarantees the performance of all our bearings, according to the current ISO 76 and ISO 281 Standards and in compliance with the recommended and correct use thereof.

# / Technical warranty

Fersa guarantees the quality of the product and the absence of defects, including shipping. Should a problem arise, Fersa guarantees the replacement of the part in question, after the corresponding tests performed by our Quality Control Department confirm the existence of such a defect.

Obviously, Fersa provides several contact channels in the event of any problem or doubt in relation to our products.

1.1 - Definition	16
1.2 - Forces applied on the wheel	17

---

## General fundamentals

### 1.1 - Definition

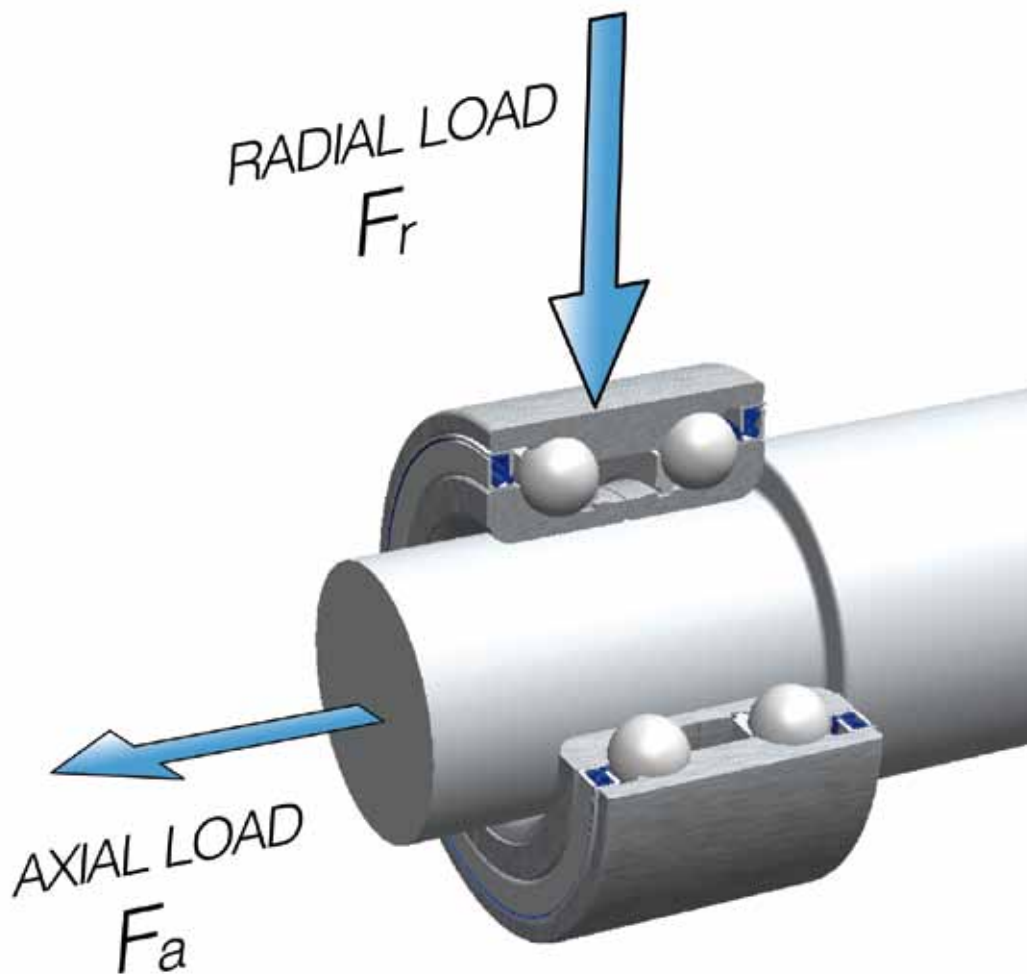

Bearings are vital machine components designed to allow rotation between two elements of a mechanism. They must be able to sustain the load coming from their own weight, and gear actions, belts, chains, etc., with minimum friction.

A bearing is generally composed of:

- Two rings, one linked to the fixed element, the other fitted to the mobile element, enabling rolling motion.
- Assembly of rolling elements, balls or rollers, that allow the displacement between the two rings.
- A cage maintaining separately the rolling elements.

A bearing can be classified in two main families:

- Those with punctual contact between rolling elements and rings, called ball bearings.
- Those with linear contact, called roller bearings.

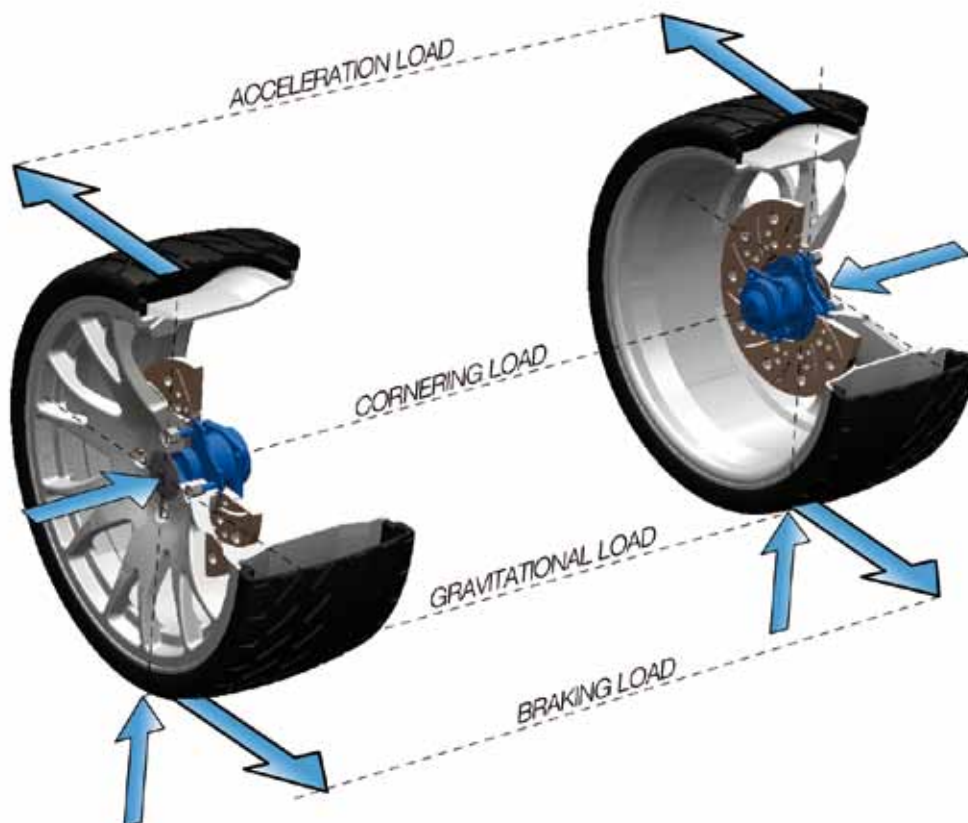

## 1.2 - Forces applied on the wheel

The assembly suspension and wheel of a vehicle should support several loads during vehicle acceleration, braking and cornering.

### Loads:

- Gravitational → opposite direction of the axle load (perpendicular to the road)
- Acceleration → between the tire and the road (in driving direction)
- Braking → between the tire and the road (opposite to driving direction)
- Cornering → between the tire and the road (in axial direction)

## Wheel bearing designs for passenger cars

### 2.1 - F-Zero

WHEEL BEARING KITS

For design F-Zero, Fersa has as bearing designations series F-18000 for ball bearings (also standard deep groove ball bearings) and series F-15000 for tapered roller bearings (also standard tapered roller bearings). F-Zero bearings are single-row deep groove ball bearings (F18000) and single-row tapered roller bearings (F15000).

F-Zero bearings have a simple design and possess a huge range for several automotive applications.

F-Zero tapered roller bearings are normally mounted in pairs. F-Zero ball bearings can be mounted as a single part. The axial clearance is set during assembly by applying the correct torque in the nut.

## 2.1.1 - Product advantages

### F-Zero: Ball bearings

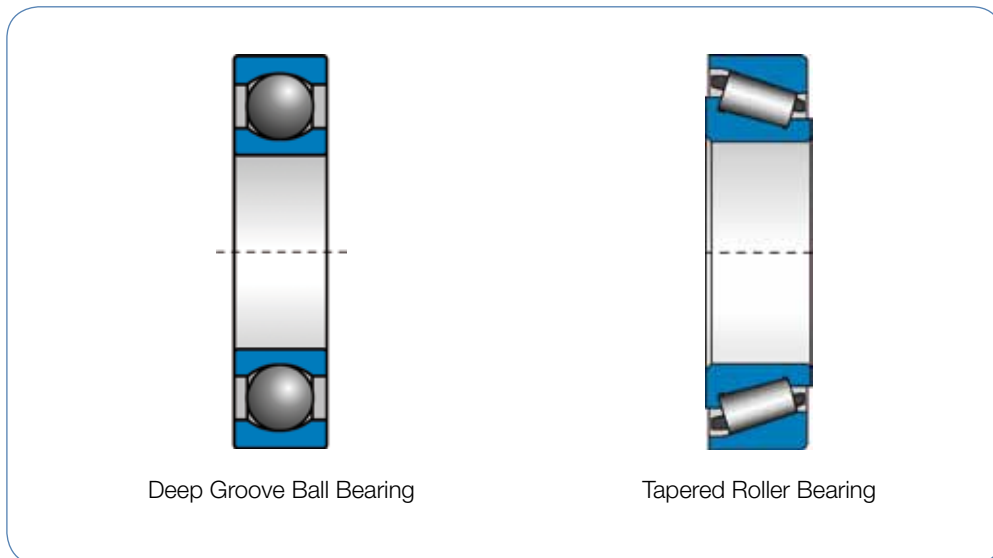

- Low costs
- For front and rear wheels
- Low noise
- Low friction torque
- Most used
- Simple Design

### F-Zero: Tapered roller bearings

- High load carrying capacity
- For front and rear wheels
- Low costs
- Axial and radial load
- Simple maintenance
- Huge range

Deep Groove Ball Bearing

Tapered Roller Bearing

### 2.1.2 - Assembly

View of a F-Zero (combined single row tapered roller bearings). Axial clearance should be set accordingly during assembly by using the corresponding mounting torque.

Assembly of F-Zero

## 2.2 - F-One

WHEEL BEARING KITS

# F One

For design F-One, Fersa has as bearing designations series F-16000 for ball bearings and series F-15000 for tapered roller bearings. F-One units are double-row angular contact ball bearings (F16000) and double-row tapered roller bearings (F15000) with two inner rings and one extended outer ring.

F-One bearing units have a defined and pre-set bearing clearance, lubrication for life and mounted sealing system. Double row angular contact ball bearings have a high moment for load capacity, meant to support the forces during cornering. F-One tapered roller bearing has a high load capacity through a space-saving construction.

The axial clearance is pre-set and takes into consideration the adjustment during assembly in order to reach the optimum preload after mounting. Additionally, the mounting seals eliminate the necessity for automotive manufacturers to use extra seals during operation.

## 2.2.1 - Product advantages

### F-One: ball bearings

- Lubricated for life
- Low costs
- For front and rear wheels
- Arranged sealing system
- Defined and preset clearance

### F-One: Tapered roller bearings

- Lubricated for life
- High load carrying capacity
- Defined and preset clearance
- Space-saving construction
- Arranged sealing system

Double Row Angular Contact Ball Bearing

### 2.2.2 - Assembly

View of a F-One after assembly. Wheel hub and drive shaft are connected to the inner rings of the bearing. Outer ring is mounted into the knuckle.

Assembly of F-One

### 2.3 - F-Two

WHEEL BEARING KITS

For F-Two, Fersa has as bearing designations series F-16000 for ball bearings and series F-15000 for tapered roller bearings. F-two units are flanged double-row angular contact ball bearings (F16000) and flanged double-row tapered roller bearings (F15000) with two inner rings and one flange as the outer ring.

**Rotating Outer ring for non-driven axles:** Wheel and brake disc are assembled at the flange. The bearing unit is mounted on the axle and fixed with a nut.

**Rotating Inner ring for non-driven axles:** The flange is fixed to the vehicle. The bearing unit is mounted on the axle and fixed with a nut.

**Rotating Inner ring for driven axles:** The flanges are fixed to the axle housing. Wheel hubs and drive shafts are connected to the inner rings.

F-Two is a combination of F-One bearing's cost efficiency and the advantages of the wheel flanges integration for bearing assembly at the brake disc and wheel. F-Two is a compact unit with defined and preset bearing clearance, lubrication for life and mounted sealing.

The axial clearance is pre-set and takes into consideration the adjustment during assembly in order to reach the optimum preload after mounting. Additionally, the mounting seals eliminate the necessity for automotive manufacturers to use extra seals during operation.

### 2.3.1 - Product advantages

#### F-Two: ball and tapered roller bearings

- Lubricated for life
- For front and rear wheels
- Arranged sealing
- Defined and preset clearance
- Integrated wheel flanges
- Possibility to integrate ABS sensor
- Easy assembly
- Lower human interference during assembly
- Lower number of components for the customer

Rotating Outer Ring - non-driven wheels

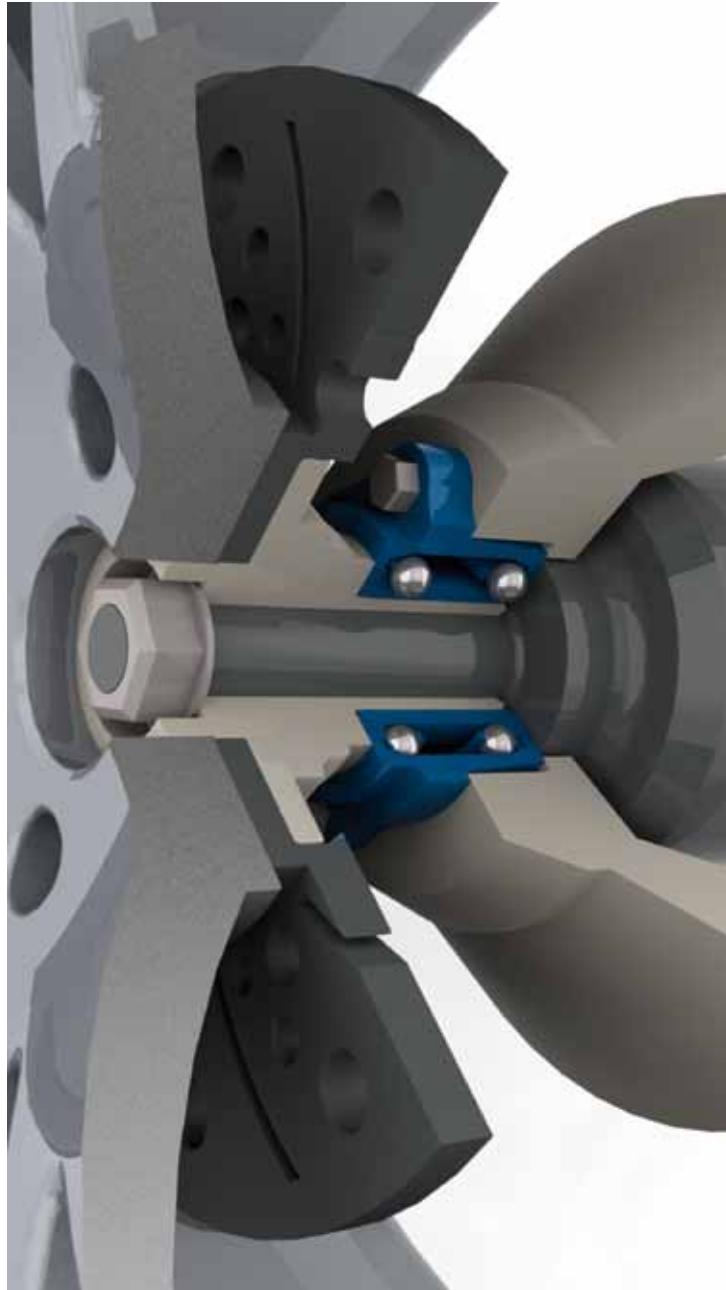

Rotating Inner Ring - non-driven wheels

Rotating Inner Ring - driven wheels

### 2.3.2 - Assembly

View of a F-Two (rotating inner rings for driven axles) after assembly. The flanged outer ring is fixed to the knuckle. Wheel hubs and drive shaft are connected to the inner rings.

Assembly of F-Two

## 2.4 - F-Three

WHEEL BEARING KITS

# F Three

For F-Three, Fersa has as bearing designations series F16000 for ball bearings and series F15000 for tapered roller bearings. F-Three units are equipped with two flanges (outer and inner rings).

**Rotating Outer ring for non-driven axles:** The wheel and brake disc are assembled at the outer ring flange. Inner ring flange is fixed on the vehicle. Pre-load is already set.

**Rotating Inner ring for non-driven axles:** The wheel and brake disc are assembled at the inner ring flange. The outer ring flange is assembled on the vehicle. Pre-load is already set.

**Rotating Inner ring for driven axles:** The wheel and brake disc are assembled at the inner ring flange. The outer ring flange is assembled on the vehicle. Pre-load is already set. The shaft end is mounted in the bearing splines and transmits rotation from the engine to the wheel.

F-Three is a bearing unit with a high integration level, with a flange fixed at the disc brake and wheel carrier, at the highest accuracy. The encoders generate the required ABS signal. This design reduces expenses in the assembly due to the construction of the two flanges.

## 2.4.1 - Product advantages

### F-Three: ball and tapered roller bearings

- Lubricated for life
- For front and rear wheels
- Arranged sealing
- Possibility of ABS integration
- Easy mounting
- Lower human interference during assembly
- Lower number of components for the customer
- High precision of disc brake and wheel guidance
- Reduced expenses of assembly due to construction of two flanges
- Pre-load is defined through the process
- Lubricated for life
- High load carrying capacity
- Defined and preset clearance
- Space-saving construction
- Arranged sealing system

Rotating Outer Ring - non-driven wheels

Rotating Inner Ring - non-driven wheels

Rotating Inner Ring - driven wheels

### 2.4.2 - Assembly

3.4 - Curvature ratio	36
3.5 - Fit influence	36
3.6 - Clearance	38
3.7 - Pre-load	39
3.8 - Relation between pre-load and axial clearance before and after mounting	39
3.9 - Influence of pre-load / axial clearance on the bearing lifetime	40

---

## Dimensioning of wheel bearing units

### 3.1 - Basic

Driving loads must be carried by the rolling elements (contact surface between raceway and rolling element). Due to this fact, the dimensions of the rows as well as of rolling elements are relevant for the bearing lifetime.

The driving conditions, i.e. number of cycles, rotation speeds, curvature ratio, impact factor, time ratio [%] are crucial for lifetime calculation. Application data as axle load, bearing offset, dynamic radius, adjustment, etc must also be taken into consideration for lifetime calculation.

### 3.2 - Lifetime calculation - $f_L$

The  $f_L$ - value is used to help selecting the correct bearing size. It comes from the ISO standard formula for lifetime and is used to compare new bearing designs to well-proven and already defined types.

The  $f_L$ - value is a non dimensional value and is meant to embrace different influences as wheel loads, numbers of revolutions, temperatures, environmental conditions, lubrication, cleanliness in the bearing, etc.

$L_{10}$ : nominal rating life [ $10^6$  revolutions]

$L_{n10}$ : nominal rating life [h]

C: dynamic load rating [kN]

P: equivalent dynamic load [kN]

p: life exponent:  $p = 3$  for ball bearings;  
 $p = \frac{10}{3}$  for roller bearings

n: number of revolutions [ $\text{min}^{-1}$ ]

$f_L$ : index of dynamic stressing [-]

$$L_{10} = \left( \frac{C}{P} \right)^p \quad [10^6 \text{ revs}]$$

$$L_{n10} = \frac{L_{10} \cdot 10^6}{n \cdot 60} \quad [\text{h}]$$

$$f_L = \sqrt[p]{\frac{L_{n10}}{500}} \quad [-]$$

### 3.3 - Contact angle

The rolling elements of a ball bearing touch the raceways at one point. The connecting line of these points runs along the raceways and goes through the center of the rolling element. Along this line an externally applied load will be transmitted from one bearing ring to the other. This line is therefore named the contact line of the bearing. The contact angle  $\alpha$  is made by this line and the radial plane.

- Nominal contact angle  $\alpha_0$ : is measured during the unloaded bearing condition, in which the balls are not in stress contact with the raceways.
- Operating contact angle  $\alpha$ : the contact angle in the bearing, which takes into consideration external influences as loads and adjustment.

The contact angle projected on the bearing axis forms an effective bearing spread. The bigger the effective bearing spread, the torque generated by the loads which can be withheld by cornering is increased.

For direct driving conditions a low contact angle leads to the longest lifetime. However this is very unfavorable for cornering.

An increased contact angle leads to the longest lifetime and a strong cornering load, but it decreases the theoretical fatigue running time for travelling straight ahead. The optimal contact angle depends on the driving conditions.

### 3.4 - Curvature ratio

For bearings with curved raceway and rolling elements, the radius of the raceway profile is slightly larger than the radius of the rolling element. This curvature difference is defined by the parameter  $k$ :

$$\text{curvature ratio } \kappa = \frac{\text{groove radius} - \text{rolling element radius}}{\text{rolling element radius}}$$

$r_J$  = groove radius of the inner ring raceway

$r_A$  = groove radius of the outer ring raceway

$r_0$  = distance of the centers of curvature

$D_W$  = ball diameter

If the curvature ratio is restricted i.e. the raceway radius approaches the ball radius, a slipping effect on the contact surface will appear, because the ball only runs off in two points of the contact area on the outer and inner rings and drifts forwards/backwards on the rest of raceway area. However the contact pressure is distributed on a large part of the raceway during a light oscillation.

On the other hand, if the curvature ratio is too big, the balls run off without the slipping effect. However, the maximum contact pressure will be higher, since the contact area of the contact ellipse becomes smaller.

### 3.5 - Fitting

#### Fitting tolerances

##### Housings:

The tolerance zone is defined as a spherical zone limited by the upper and lower limit dimensions of the part. The tolerance zone is therefore determined by the amount of tolerance and its position related to the basic size. The position of the tolerance zone, related to the basic size (zero line), is determined in the ISO system by a so-called basic deviation. The ISO system defines 28 classes of basic deviations for the holes. These classes are marked by capital letters (A, B, C ... ZC). The tolerance zone for the specified dimensions in the drawing is indicated by a tolerance mark, which consists of a letter marking of the basic deviation and a numerical marking of the tolerance grade (e.g. H7, H8, D5, etc.).

## Shafts:

The tolerance zone is defined as a spherical zone limited by the upper and lower limit dimensions of the parts. The tolerance zone is therefore determined by the amount of tolerance and its position related to the basic size. The position of the tolerance zone, related to the basic size (zero line), is determined in the ISO system by a so-called basic deviation. The ISO system defines 28 classes of basic deviations for the shafts. These classes are marked by lower case letters (a, b, c... zc). The tolerance zone for the specified dimensions in the drawing is indicated by a tolerance mark, which consists of a letter marking of the basic deviation and a numerical marking of the tolerance grade (e.g. h7, h6, g5, etc.).

Bearings must be fixed on the axle and also in the housing in radial, axial and circumferential directions. Radial and circumferential adjustments are achieved by tightly fitting the rings of the bearing. Axial location can partially be achieved by ensuring a tight fit.

It is necessary to take into consideration the following requirements when selecting the correct fitting:

- Bearings must be mounted accordingly and supported over their circumference in order to optimize the load-carrying capacity.
- Sliding between surfaces in a circumferential direction is not allowed in order to prevent damaging.
- Bearing must have axial latitude to adjust length variations of shaft and housing.
- Correct assembly and disassembly.

The tolerance is the difference which can be tolerated or admitted between the nominal value and the real or effective value in the physical and chemical characteristics of a material, piece or product.

The measuring unit for tolerances is the **micron ( $\mu\text{m}$ )**.

## Fitting - shaft size variation

## Fitting - housing size variation

### 3.6 - Clearance

The total distance through which one bearing ring can be moved relative to the other in the radial direction (radial internal clearance) or in the axial direction (axial internal clearance) without a load.

### 3.7 - Pre-load

The preload serves to provide a minimum load on the bearing and prevent bearing damage as a result of sliding movements of the rolling elements.

The main reasons to apply bearing preload are to:

- Enhance stiffness
- Reduce running noise
- Enhance the accuracy of shaft guidance
- Compensate for wear and settling (bedding down) processes in operation
- Provide long service life

### 3.8 - Relation between pre-load and axial clearance before and after mounting

Interference generated by adjustment in F-One designs (double row tapered roller bearings and double row ball bearings) has a significant influence in Axial Clearance / Pre-Load relations.

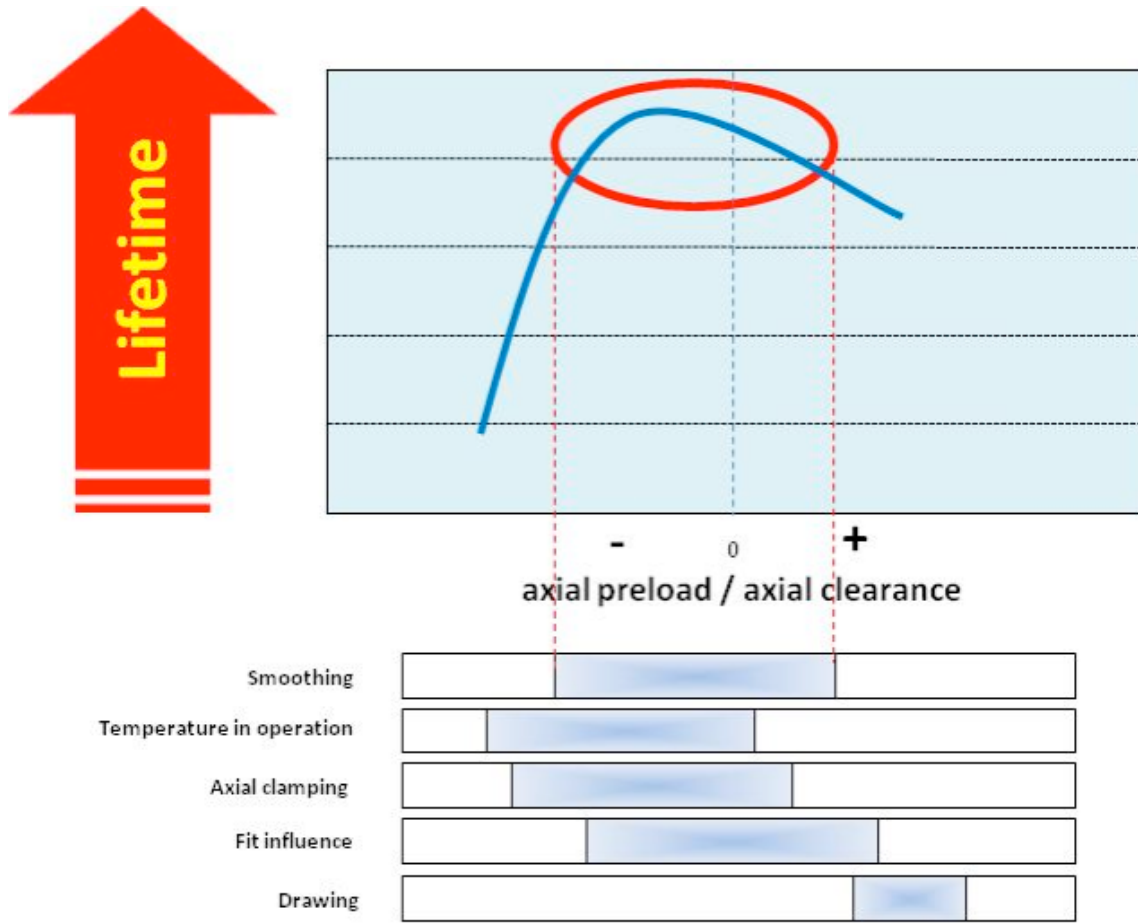

In this kind of bearings there are 2 contact surfaces: one between the housing and outer ring and another between the shaft and inner rings. This interference generates a bearing elastic deformation, which narrows the axial clearance defined in the drawing.

In addition to the adjustment, the mounting torque (applied on the nut) will usually convert the initial axial clearance into a pre-load after assembly.

For F-Two designs there is only one contact surface (between shaft and inner rings), which makes the axial clearance specified in the drawing smaller than the clearance of F-One designs. The mounting torque is also required for this kind of bearings in order to define the final pre-load.

F-Three is the Fersa design with the highest integration level and the pre-load is already defined from the production process. Due to this fact, there is a very low variation of the pre-load (insensitivity). This design avoids mistakes by setting the pre-load during the assembly.

### 3.9 - Influence of pre-load / axial clearance on the bearing lifetime

Wheel bearings usually achieve their longest lifetime performance in operation under pre-load. Except for Fersa F-Three where the pre-load is already set, the pre-load of other wheel bearing designs have to be set during assembly.

A significant part of this setting is the fit influence. Tolerances of the bearing rings and also tolerances from the housing and shaft should be taken into consideration during mounting in order to reach the theoretical pre-load described in the drawing.

After the mounting it is mandatory to apply the corresponding mounting torque with a nut (specified by the vehicle manufacturer). With this procedure the bearing should operate in its best condition

# 04/ Antilock-brake system (ABS)

## 04 Antilock-brake system (ABS)

---

4.1 - Introduction	44
4.2 - Passive encoder	44
4.3 - Multi-pole encoder	45
4.4 - Sensors	45

---

# Antilock-brake system (ABS)

## 4.1 - Introduction

With the evolution of automotive technology, safety has become a fundamental requirement. For reasons of both safety and driving comfort, more and more vehicles are being equipped with speed sensing devices (primarily sensors that provide a signal system with the wheel speed information). The optimum wheel speed sensor solution is unique for each individual application. Due to this fact, the Antilock Brake System (ABS) has become globally used in the automotive sector, ensuring safe braking on slippery and icy roads.

ABS functions to prevent individual wheel lockup. It helps the driver, by providing steering control, in order to keep control of vehicle in case of emergency. Since a locked up wheel cannot be steered, the ABS permits the driver to control the vehicle even during strong pumping of the brake pedal and it reports active data used to control decisions as a reaction to changing of road conditions.

## 4.2 - Passive encoder

A passive encoder is generally a metallic impulse ring and it rotates at the same speed of the wheel. The sensor should be mounted nearby the impulse ring. Apart of getting a signal from the impulse ring, a sensor should transfer it to the Electronic Control Unit (ECU), in order to control the brake force. It is not mandatory that an impulse ring should be assembled on the bearing. It can be mounted on rotating components, which belong to the wheel system as CV-Joint, drive shaft, etc.

Passive axial encoder

Passive radial encoder

F-Two equipped with passive radial encoder

### 4.3 - Multi-pole encoder

This system uses a magnetic ring, in place of a conventional metallic impulse ring. The magnetic sensor (active sensor) mounted on the vehicle is able to detect rotation speed of the wheel. The multi-pole encoder can be designed in both radial and axial direction.

Active sensor + multi-pole encoder

### 4.4 - Sensors

By applying an active sensor, the multi-pole encoder permits a regular output. For this reason, the encoder can recognize wheel rotation speed, even when running at a very low speed. Active sensor do not require magnets, reducing cost and weight.

Depending on vehicle requirements and design, the sensors are defined as non-integrated and integrated designs. The non-integrated design is used in the most ordinary applications and the integrated design is used when weight and assembly time saving are needed.

There are two types of sensors: passive and active. The passive sensors can provide a signal at low speed, which would be enough for the operation of a vehicle equipped with ABS. The active sensors can provide signal at speed zero, which is needed for systems such as navigation and traction control.

Independently of the solution, sensor integration would offer:

- Reduction of assembly time
- Reliability improvement
- Reduction of space requirements
- Weight reduction

Passive sensor

Active sensor

# 05/ Lubrication

## 05 Lubrication

---

<b>5.1 - Introduction</b>	<b>48</b>
<b>5.2 - Types of lubrication</b>	<b>49</b>
<b>5.3 - Types of lubricants</b>	<b>50</b>

---

# Lubrication

## 5.1 - Introduction

Approximately 45% of bearing failure and breakdowns are due to inadequate or insufficient lubrication, hence why lubrication is such an important aspect of the bearing.

The main function of a lubricant is to allow for the correct rotation a movement between the various rolling elements of a bearing, reducing friction between the contact surfaces and therefore reducing damages.

Lubrication inhibits contamination, avoids impurities, improves sealing and protects against corrosion. The main purpose of the lubrication process is to prolong the service life and optimal performance of the bearing for as long as possible.

Today there is an increasing concern for the effect that lubricants may have on the environment. Recently Fersa has collaborated, together with other companies and technological centers, with the CRAFT project of “the BIOMON European Commission, towards long life bio-lubricants, using advanced design and monitoring tools”, whose main objective has been the development of bio-degradable lubricants which are to be used in different mechanical industrial applications.

## 5.2 - Types of lubrication

To lubricate is to apply a layer of lubricant between the raceways and the rolling elements. This keeps the different contact surfaces separate and prevents direct metal-to-metal contact between them.

The choice of lubricant depends on several factors:

- Viscosity of the lubricant.
- Geometric conditions of the rolling elements (the superficial texture is especially important).
- Environmental conditions (temperature, vibrations...), as well as the presence of foreign particles and contamination.
- Working conditions (rotation speeds, loads, mounting, fatigue...).

All of the above are determining factors when selecting the best lubricant and best application process (amount, cleaning, re-lubrication intervals...) for the specific bearing. Depending on the lubrication applied, different lubrication situations can occur:

### 5.2.1 - Total or hydrodynamic lubrication (pic. 1):

The surfaces of the elements implicated in the rotation are totally separated by the lubricant film in place. This is the ideal lubrication situation, since there is no wear between surfaces and the friction rate is very low.

Total or hydrodynamic lubrication (pic. 1)

### 5.2.2 - Partial lubrication (pic. 2):

This is the true lubrication scenario, since there are some areas in contact despite the existing layer of lubricant.

Partial lubrication (pic. 2)

### 5.2.3 - Lubrication by boundary layer (pic. 3):

When the amount of lubricant is insufficient or the relative movement too slow, the layer is thinner and cannot prevent metal-to-metal contact; which causes more friction and generates more heat, which in turn increases the temperature and further reduces the layer of lubricant protection available.

To prevent this, additives are used in the lubricant. These additives react with the metal parts and generate a boundary layer that reinforces the lubricant protection.

Lubrication by boundary layer (pic. 3)

### 5.2.4 - Solid lubrication:

For less severe working conditions, there are different types of solid lubricants (graphite, lithium grease...) to help improve lubrication that prevents direct metal-to-metal contact between surfaces.

### 5.3 - Types of lubricants

There are two main lubrication options to choose from, grease or oil:

#### 5.3.1 - Grease

Grease is the most widely used type of lubricant:

- Simpler design and more economical lubrication system.
- Less maintenance needed (there is a life lubrication option available).
- Good tightness and low contamination risk (cleaning).

Grease lubrication provides a high safety level at low speeds. They are oil based (mineral, silicon, ester) mixed with lithium, sodium or calcium soap thickener for density (sometimes salt from the metal soap is added to form a thickening complex). Polyurea, Teflon or bentonite can be used instead of soap.

When selecting grease, the consistency, temperature range and corrosion resistance, miscibility, mechanical stability, rate of fluidity, etc., determine its suitability to perform under different conditions and work requirements (load carrying ability, speed, temperature, vibrations, etc.). The following table shows detailed information of the capacities of the different greases:

Type of grease	Lithium		Sodium		Calcium		Bentonite	Polyurea	Teflon
	N	C	N	C	N	C			
Temperature (°C)	-30 / 130	-30 / 160	-30 / 100	-30 / 120	-30 / 60	-30 / 130	-30 / 160	-40 / 210	-35 / 250
Pressure	1	2	1	2	1	2	1	1	2
Water resistant	3	2	1	1	3	2	3	3	3
Corrosion	2	1	2	3	2	2	1	1	1

N= Normal  
 C= Complex  
 1- Regular resistance      2- Good resistance      3- Very good resistance

#### 5.3.2 - Lubrication processes-grease

Under not very severe working conditions, there is a life lubrication option that also uses seals to help keep the lubricant inside in the bearings (especially where high vibrations and temperatures are concerned). However, under more severe conditions re-lubrication is necessary. Also the bearing must be greased once it is mounted, before being operative (reduces contamination risk) and should have been cleaned before greasing if not new. The amount of grease should not be excessive (possible engine size-up), nor should it be insufficient (damage to bearing).

The amount of grease should range approximately between 20 to 35% of the empty space in the bearing. The bearing should be fully rotated so that it is totally immersed in grease.

$$g = 0,0121 \times (D-d) \times B$$

### 5.3.3 - Oils

Oil lubrication is used in 10% of bearing applications.

- Good performance at high speeds and heavy loads.
- Better ability for heat dissipation.
- More precise and efficient cleaning of particles.
- Possibility of recycling oil to lubricate other bearing elements (cost reduction).
- Easy monitoring of lubricant (condition and level).

The following oils are used on bearing applications:

- Minerals (most often used).
- Synthetics (used for specific applications): polyolefin, polyglycol, ester, oil fluorides, silicon oils...

When selecting an oil with the correct viscosity; temperature range, speed and load to be carried must be taken into account. The following table shows detailed information of the different oils and their specifications:

Type of oil	Synthetic oils					
	Mineral oils	Polyglycols	Polyalphaolefines	Esters	Silicone oils	Fluorated
Viscosity 40°C (mm <sup>2</sup> /sg)	2 / 4500	20 / 2000	15 / 1500	7 / 4000	4 / 100000	20 / 650
Temperature (°C)	-50 / 170	-50 / 200	-20 / 160	-60 / 120	-70 / 200	-60 / 250
Loads	3	3	3	2	1	2
High speed	2	2	2	3	2	2
Rusting	1	3	2	3	2	3

1- Regular resistance    2- Good resistance    3- Very good resistance

An oil lubricant should be chosen according to the required viscosity in order to guarantee an adequate lubrication in relation to the working temperature.

The time lapse from functioning to fatigue and protection from wear is best when the contact surfaces are well separated by the lubricant. Because the thickness of the lubricant layer increases with the oil viscosity, in theory oil with high viscosity should be chosen for the application. However, as the viscosity increases so does the friction of the lubricant, so the oil lubricant chosen should have enough viscosity to sustain the fatigue, while at the same time providing enough oil lubrication for the bearings.

There is a certain K relation between the viscosity ( $\nu$ ) of the selected oil to the temperature when the bearing is functioning, and the necessary cinematic speed  $v_1$  for a satisfactory lubrication.

### 5.3.4 - Lubrication processes-oil

If an excessive amount of oil is used, the cooling level is good, but friction increases. For this situation there are different lubrication systems:

- **Oil bath or immersion:** A simple method for low speeds. When not moving, the bath should cover half of the lower part of the rolling element, so that when it rotates the oil is distributed on all of the parts. The oil level should be checked periodically and replaced according to contamination and wear (especially when temperatures are high and if oxygen and abrasives are present). This should be done every two months.

Oil bath

- **Oil circulation:** Oil is brought to the bearing from a deposit by a system of pumps, tubes and valves. The bearing should be lubricated before being operative and the amount of oil depends on the working conditions and the size of the bearing (more or less, between 0, 5 and 50 l/m). This procedure in combination with the oil bath greatly improves the bearing's features.

Oil circulation

- **Injection of oil:** at high speed (at least 15 m/s). It is advisable to inject the oil in the direction of the bearing.

Injection of oil

With small quantities of oil (10 mg / h), using a lubrication system through a drip, oil mist or transported through the air, which results in a more precise lubrication, therefore forming a film between the contact surfaces which decreases the friction and maintains a low temperature.

Lubrication by dripping

# 06/ Sealing

## 06 Sealing

# Sealing

## 6.1 - Definition

Given certain applications, the mounted bearings must be protected with sealing mechanisms. These mechanisms must carry out two basic functions:

- Prevent external dirt or humidity from entering.
- Prevent lubricants from leaking out.

The service life of the bearings very often depends on the efficiency of these mechanisms. The sealing mechanisms may vary a lot, and various factors must be considered when choosing the one to be applied:

- Type of lubricant (oil or grease).
- Rotation speed.
- Available space.
- Seal friction.
- Cost, etc.

Concerning the sealing function, if the two mechanical parts between which the leakage is likely to occur are fixed with relation to each other, the seal is called a static seal. If one or both of these parts are moving relative to the other, the seal is called a dynamic seal.

Many different methods have been or are still used for sealing, such as:

- |   |  |
|---|--|
| - With contact  | - Contactless  |
| <ul style="list-style-type: none"> <li>• Felt rings</li> <li>• Oil lip seals</li> </ul> | <ul style="list-style-type: none"> <li>• Oil grooves</li> <li>• Deflecting ring</li> <li>• Labyrinth glands</li> </ul> |

## 6.2 - Sealing Elements

## Felt rings

- Simple and widely used.
- Suitable for lubrication with grease.
- Speed limit: 3-5 m/sec.
- Not suitable for high speeds or high temperatures.
- Best performance when several felt rings are used together and in combination.
- Suitable in cases without excessive dirt.

## Retainers for oil and grease

- Oil lip seals.
- Standard parts. A large variety of types and sizes.
- Capacity to tolerate axle misalignment.
- The axle must have an appropriate finish and hardness.
- The sealing is a result of the lubrication film between the retainer and the axle.
- Appropriate thickness of the film must be maintained.
- Speed limit: 10-18 m/sec.
- Be careful when installing.

One lip without spring

One lip with spring

Double lips without spring

Double lips with spring

### Oil grooves

- Oil grooves in shafts, housing or both. They can have a helicoidal shape (applications with only one direction of shaft rotation) so that they can function as lubrication pumps.
- Particularly well suited in cases of low grease and low speed.
- The space between the shaft and housing should be as small as possible.
  - ⎧ O shaft < 50 mm → 0, 25 – 0, 4 mm.
  - ⎨ O shaft > 50 mm → 0, 5- 1 mm.
- Width: 2-5 mm / Depth: 4-5 mm.
- They are frequently used in combination with other sealing elements. Performance can be improved if filled with groove grease.

Groove in the box

Groove in the axis

Groove in the box and axis

Helicoidal groove

### Deflecting ring

- Prevents the flow of particles and entry of dirt by centrifugal force and air flow.
- Used frequently in combination with other sealing elements.
- Limits speed: 10 - 18 m/sec.

Types

- Installed inside the box: the lubricant is introduced through a pump preventing leaks.
- Installed outside the box: prevents the entry of foreign materials into the housing.
- Type of cover: it removes the dirt by a centrifugal force.
- Forms a labyrinth with the box: the lubricant is introduced through a pump, preventing leaks.

Inside the box

Outside the box

Labyrinth

Lid

## Labyrinths

- The most suitable sealing system for high speeds (no friction).
- The number of grooves varies. If the number is increased, the labyrinth is more effective (less likely to have a leak).
- Its effect can be improved by filling them with grease
- Recommended measurement (mm).

$\left\{ \begin{array}{l} \text{Ø shaft} < 50 \text{ mm} \rightarrow \text{Radial: } 0.25\text{--}0.4 / \text{Axial: } 1\text{--}2 \\ \text{Ø shaft} > 50 \text{ mm} \rightarrow \text{Radial } 0.5\text{--}1 / \text{Axial: } 3\text{--}5 \end{array} \right.$

Types  $\left\{ \begin{array}{l} \text{Axial: for single housing} \\ \text{Radial: for complex housing} \end{array} \right.$ 

 $\left\{ \begin{array}{l} \text{Attention: Can be oblique if you wait for a considerable} \\ \text{misalignment between the axle and housing} \end{array} \right.$
